

Industry Specific Program (draft)

November 10, 2010

Energy Efficient Buildings & Sustainable Community Planning

Sweden at the forefront:

Swedish construction standards are the highest in Europe due to the manner in which corporations deal with community development projects as well as their desire to integrate their goals for a sustainable way of living. By collaborating and partnering with local energy companies Swedish entrepreneurs and companies are able to create efficient construction solutions while still achieving desired environmental goals.

What to expect:

- * To see first-hand how passive building standards can be incorporated into a wide variety of existing and new construction projects - both commercial and residential - on a wide scale basis.
- * To actively participate in discussions with industry peers and leaders throughout the day and share experiences, ideas and business opportunities regarding the development of energy-efficient buildings and passive buildings.
- * To see how Gothenburg is successfully integrating sustainable resources into its community planning and development by utilizing cutting-edge environmental research and the latest in clean technology.
